History of Photoshop Phil Aquila designed the earliest version of Photoshop in 1989. In 1991, the initial Macintosh version was launched in the computer trade market. Adobe bought the company, and in 1994, Photoshop became a

general-purpose editing application for the Macintosh. Following this, the software was made available for the Windows platforms in 1996. In addition, the software became available for the first time as a plugin for the Microsoft Office applications in 1997. In 1998, the final version of

the Photoshop software was released for the Windows platform. In January 2006, after the bankruptcy of Aldus, the creator of PageMaker, Adobe released the new Adobe Creative Suite 1.0. Following the release, software versions were released at a faster pace. In July 2007, at Adobe MAX, a

new version, Photoshop CS2, was launched. After this, CS2 was redesigned again in the third quarter of 2007 for a better user experience. In 2008, Adobe released the new Photoshop CS3 that was based on the user interface that was introduced to Adobe Creative Suite 2. In early 2011, Adobe released a

Raspberry Pi 3 as a Crash Course in Computer Scratch Programming "Ever since my school days I always wanted to learn a programming language, and now thanks to Pi and Scratch I can start working in this field." – Ahmed M. Gharaibeh,

Egypt, Read more There is no shortage of resources to help you get started with programming using the Raspberry Pi. The Wikipedia entry has a fairly good introduction, and there are many programs which have already been written to teach children as young as 5 or 6 to program.

What, though, about teaching children who are a little bit older? The Raspberry Pi Foundation has recently announced its newest board, the Pi 3, which costs £10. This new board packs a significant boost in processing power, as well as new features. I'm sure that many parents and teachers will

welcome this: a £10 computer, loaded with all sorts of different programs and activities, that can be used to learn about the computer system, as well as lots of other things. But there's a catch: the previous version of the Raspberry Pi, the Pi 2, was a pretty weak performer. It only supported Python

scripting, and was barely fast enough to run a few programs. So it has now been superseded. Now Python programming is no longer an option. But it's still possible to get programming-ready on the Pi 2, and there are certainly some excellent programs and resources for this version. I've already blogged recently

about the Write.Works website, which is a good programming resource for children, though one which is a little out of date. Another great site is Scratch, which is a graphical programming language which runs well on the Pi 2 and 3. This version has just been released – last week, in fact. It's still an early

version, with some bugs to sort out. But it includes much of the functionality that Scratch will have once it's ready for use in schools. And it does so in a platform which is very easy to grasp, and which will allow children who want to learn to program to leap straight in. I've been using the

scratch.mit.edu website with my 5 year old daughter, and it's been an interesting experience. She can pick up things pretty quickly, but it's clear that she's going to want to use more complex programs before long,
